CSCI-3403: Cyber Security
Spring 2020

Biljith Thadichi

Department of Computer Science

University of Colorado Boulder

Week 2
> HTML Intro
> Code walkthrough
> Developer Tools

If you're not motivated enough!

Assignment 2 Extra Credit

Note: You should only be writing HTML, and maybe a little CSS in this assignment. If you're using anything else, you're doing it wrong!

During the course of the semester, we're going to make a discussion forum. A very basic discussion forum. Students will be able to view the forum, and if they log in, then they can make a post on the site. You should build a site that does this.

You have a lot of freedom to make the site whatever you want. You can make a discussion board for dental hygiene, or a forum for you favorite game. Take some pride in it! The only technical specifications are that it should include: a login form, a table, divs as necessary, and appropriate uses of ids and classes.

Web Development

Frontend development (Client side)

- Part that users interact with
- **Learn HTML** to structure a website, **CSS** to style a website, **JavaScript** to add interactivity to a website
- Frontend Frameworks and libraries

Backend development (Server side)

- The back end of a website consists of a server, an application, and a database, that makes a front end possible
- Backend Languages

HTML Introduction

- HTML is not a programming language, it is a markup language

- HTML consists of a series of elements, which you use to enclose, or wrap, different parts of the content to make it appear a certain way, or act a certain way.

- The enclosing tags can
  - Make a word or image hyperlink to somewhere else
 - Italicize words
  - Make the font bigger or smaller

Anatomy of an HTML element
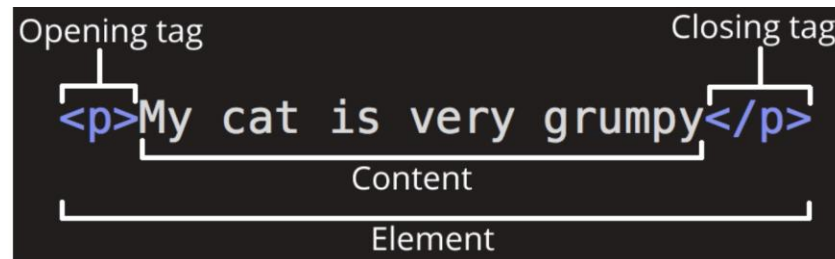

- **Opening tag**: This consists of the name of the element (in this case, p), wrapped in opening and closing **angle brackets**. This states where the element begins or starts to take effect — in this case where the paragraph begins.

- **Closing tag**: This is the same as the opening tag, except that it includes a *forward slash* before the element name. This states where the element ends — in this case where the paragraph ends. Failing to add a closing tag is one of the standard beginner errors and can lead to strange results.

- **Content**: This is the content of the element, which in this case, is just text.

- **Element**: The opening tag, the closing tag and the content together comprise the element.

University of Colorado Boulder

Anatomy of an HTML element

- Elements can also have attributes that look like the following:

- Attributes contain extra information about the element that you don't want to appear in the actual content. Here, class is the attribute *name* and editor-note is the attribute *value*. An attribute should always have the following:
  - A space between it and the element name (or the previous attribute, if the element already has one or more attributes).
  - The attribute name followed by an equal sign.
  - The attribute value wrapped by opening and closing quotation marks.

Anatomy of an HTML document

```
1   <!DOCTYPE html>
2   <html>
3     <head>
4       <meta charset="utf-8">
5       <title>My test page</title>
6     </head>
7     <body>
8       <img src="images/firefox-icon.png" alt="My test image">
9     </body>
10  </html>
```

- `<!DOCTYPE html>`
  - Basically needed to ensure your document behaves correctly

- `<html></html>`
  - This element wraps all the content on the entire page and is sometimes known as the root element.

- `<head></head>`
  - This element acts as a container for all the stuff you want to include on the HTML page that *isn't* the content you are showing to your page's viewers.
  - This includes things like CSS to style your content, character set declarations and more.

University of Colorado
Boulder

Anatomy of an HTML document

```
1   <!DOCTYPE html>
2   <html>
3     <head>
4       <meta charset="utf-8">
5       <title>My test page</title>
6     </head>
7     <body>
8       <img src="images/firefox-icon.png" alt="My test image">
9     </body>
10  </html>
```

- `<meta charset="utf-8">`
  - Sets the character set your document should use to UTF-8, that can handle any textual content
- `<title></title>`
  - This sets the title of your page, which is the title that appears in the browser tab the page is loaded in
- `<body></body>`
  - This contains *all* the content that you want to show to web users when they visit your page, text, images, videos, games.
